QC management approval

This Certified Reference Material was verified in accordance with ISO/IEC 17025
This solution was assayed titrimetrically, using EDTA which was standardized against NIST SRM #915a (calcium carbonate).
A product with a suffix (-1A, -2B, etc. or -01, -02, etc.) on its lot number has had its expiration date extended and is identical to the same lot number without the suffix.
The gravimetric uncertainty for this product is ±0.24%. The CRM uncertainty is ±2.4%.
In order to verify the concentration(s), the final solution was checked by plasma emission spectroscopy (ICP) against material traceable to the above listed NIST SRM(s).
We use the highest purity raw materials available to minimize impurity levels in the final solution. Typically 99.999%+ pure starting materials are used as well as high purity acids and ASTM Type 1 18 megohm deionized water.
All trace level elemental impurities were determined via plasma emission spectroscopy on the concentrate.
All weights are traceable through NIST, Test No. 684/289871-17
All glassware used in preparation is Class A.
All bottles are acid leached and triple rinsed with deionized water prior to use.
Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware. Keep bottle tightly capped.

ICP-MS

Single Element

ICP-MS Standards are formulated to meet the needs of this very special instrument. As matrix effect is of utmost concern, each standard is formulated in specially purified 18 megohm deionized water and ultra pure acids.

- Traceable to NIST reference materials
- 18 Megohm deionized water
- ppb level contaminants reported on Certificate of Analysis
- Ultra high purity starting materials and acids
- Minimum 3 year shelf life
- Concentration verified by wet chemical and instrumental analysis

Wet Chemicals

Our Wet Chemical Standards are prepared from the highest quality raw material according to ASTM, EPA or "Standard Methods" ¹ procedures. All balances used in preparation are calibrated against NIST traceable weights. Each batch of finished product is analyzed to verify concentration against NIST standards when possible. All of our Wet Chemical standards are subject to the same rigorous quality control procedures as our ICP and IC standards.

USP 232 Elemental Impurities

Limits for the amounts of elemental impurities in drug products are specified by the United States Pharmacopeia (USP) and the International Council for Harmonisation (ICH). These limits are detailed in USP General Chapter 232 and ICH Guideline for Elemental Impurities Q3D. Standards based on oral permitted daily exposures along with an internal standard are provided, as well as high and low level multi-element calibration standards, which allow for quantitative analysis through custom applications. Additional custom standards are available.

Cannabis and E-Cigarette Standards

Cannabis - Heavy Metal Analysis

Regulations for the testing of heavy metals in cannabis products differ based on state requirements and the route of administration. These standards can be used for commonly set maximum limits or to provide flexibility to allow calibration over a wide range of concentrations.

Cannabis Metals 1

CP-MET-01-1 **100 mL**
At stated conc. (µg/mL) 4 comps
2-5% Nitric acid

Arsenic (As)	15	Lead (Pb)	5
Cadmium (Cd)	5	Mercury (Hg)	30

Cannabis Metals 2

At stated conc. (µg/mL) 4 comps
2-5% Nitric acid

Arsenic (As)	20	Lead (Pb)	50
Cadmium (Cd)	20	Mercury (Hg)	10

Testing of heavy metals is important because metallic impurities can be absorbed from the soil when the plant grows, or be introduced during preparation of the consumer product.

Calibration Standards and Matrix Blanks

ICP-MS Standards are formulated to meet the needs of this very special instrument. As matrix effect is of utmost concern, each standard is formulated in specially purified 18 megohm deionized water and ultra pure acids.

- Traceable to NIST reference materials
- 18 Megohm deionized water
- Concentration verified by wet chemical and instrumental analysis
- Ultra high purity starting materials and acids

Technical Note

These memory check solutions are not designed to be used as standards. The solutions should be mixed together right before aspiration. Precipitate will form over time - this is normal and will not affect the performance of the solution. The mixture is used only to determine the memory or "carry-over" that occurs after running a "concentrated" solution.

Organometallic Standards

AA, ICP, DCP & XRF Analysis

These Standards were formulated for the analysis of metals in oils and other organic matrices. The standards provide a convenient way to analyze for metals (wear metals, additives and contaminants) in lubricating oil, gasoline, residual oil, crude oil, turbine fuel and environmental samples. Organometallic Standards listed on this page may contain sulfur which can be introduced by possible sulfonated starting materials used to formulate the actual organometallic standard.

- Single & Multi Element Standards
- Formulated from Ultra High Purity Organometallic starting materials & matrices
